

FOR IMMEDIATE RELEASE

Range Systems Introduces Innovative Breach Door System

New Hope, MN—Range Systems has developed an innovative breach door system that effectively adapts to mission specific training. The Quick Hinge Breach Door System has the unique capability of supporting multiple breaching techniques including mechanical, ballistic, and explosive with hollow, solid core, and steel doors.

The heavy gauge Quick Hinge steel frame accepts commercial off-the-shelf doors to provide the most realistic breaching using real doors with real door properties. There are no ballistic pins to insert or replace, no special panels to install, and no tools required to employ the Range Systems Quick Hinge Breach Door System.

There are significant advantages with the Quick Hinge Breach Door, Range Systems' Glenn Seeger explained. "The unique capability of supporting multiple breaching training techniques with one breach door system eliminates the need to sustain a variety of single purpose training doors. In today's economy with constricting budgets, we wanted to develop a versatile training solution that doesn't compromise on capability or performance, and yet would be cost-effective."

Range Systems Quick Hinge Breach Door System adapts to specific training needs and can be installed in existing training facilities, shoot houses, or used as a portable, free-standing training system that can be transported to multiple training sites.

About Range Systems

Range Systems specializes in the design and manufacture of live fire shoot houses, ballistic containment systems, indoor and outdoor firing range equipment and other specialty equipment for small arms and tactical training required by the armed forces, law enforcement agencies and the security industry worldwide.
